SEÇÃO 3 – Propriedades de autovalores e autovetoresVER DEMONSTRAÇÕES NA SECÇÃO 3 DO MATERIAL COMPLETO.

Propriedade 1: seja v um autovetor do operador linear T associado ao autovalor λ . Então, o autovetor $\alpha \cdot v$ ($\alpha \neq 0$) é também um autovetor de T associado ao autovalor λ .

Em outras palavras, se v é um autovetor associado a um autovalor λ , então qualquer múltiplo escalar de v também é um autovetor associado ao mesmo autovalor λ . Assim, todo operador linear que possui pelo menos um autovetor tem infinitos autovetores associados ao mesmo autovalor.

Propriedade 2: sejam T : V \rightarrow V e o conjunto $T_{\lambda} = \{v \in V; T(v) = \lambda \cdot v\}$. T_{λ} é um subespaço vetorial.

Em outras palavras, o conjunto de todos os autovetores v associados ao mesmo autovalor λ é um subespaço vetorial de V.

4.7. Seja T : $\mathbb{R}^2 \to \mathbb{R}^2$ em que $\mathbb{T}(x, y) = (2x + 2y, y)$.

$$A = \begin{pmatrix} 2 & 2 \\ 0 & 1 \end{pmatrix}$$

$$A - I \lambda = \begin{pmatrix} 2 - \lambda & 2 \\ 0 & 1 - \lambda \end{pmatrix}$$

$$\det (A - I \lambda) = \begin{vmatrix} 2 - \lambda & 2 \\ 0 & 1 - \lambda \end{vmatrix} = \begin{pmatrix} 2 - \lambda \end{pmatrix} \begin{pmatrix} 1 - \lambda \\ 0 & 1 - \lambda \end{pmatrix} = 0$$

$$\lambda_1 = 1 \wedge \lambda_2 = 2$$

Se
$$N=1$$
 $(A-I\lambda_1)V_1=0$
 $(1 \ 2)(x)=(0) \longrightarrow x+2y=0$
 $(2 \ 2)(x)=(0) \longrightarrow x=-2y$
 $V_1=(-2y,x)=y(-2,1)$
 $V_2=(-2,1)=(-2,1$

4.8. Tome o exemplo 4.4 da Seção 2:

seja T :
$$\mathbb{R}^3 \to \mathbb{R}^3$$
, tal que T(x, y, z) = (x, 2x - 2y, -3x + y + 2z).

Este operador linear tem os seguintes autovetores e autovalores:

Autovalor	Autovetor
$\lambda_1 = -2$	$v_1 = (0, -4, 1)$
$\lambda_2 = 1$	$v_2 = \left(1, \frac{2}{3}, \frac{7}{3}\right)$
$\lambda_3 = 2$	$v_3 = (0, 0, 1)$

Pela propriedade 2, temos os seguintes subespaços vetoriais:

- $T_{\lambda_1} = \{v \in \mathbb{R}^2; x = 0 \text{ e } z = -4y\}$, que, geometricamente, é uma reta no espaço que passa pela origem e pertence ao plano yOz;
- $T_{\lambda_2} = \{v \in \mathbb{R}^2; y = \frac{2}{3}x \text{ e } z = \frac{7}{3}x\}$, que geometricamente é uma reta no espaço que passa pela origem; e
- $T_{\lambda_2} = \{v \in \mathbb{R}^2; x = y = 0\}$, que geometricamente é o eixo z.
- 6. Seja o operador $T: \mathbb{R}^3 \to \mathbb{R}^3$, em que:

$$T(x, y, z) = (x - y, 2x + 3y + 2z, x + y + 2z).$$

Encontre os subespaços vetoriais T_{λ} para cada autovalor e expresse geometricamente cada um dos subespaços encontrados.

$$A = \begin{pmatrix} 1 & -1 & 0 \\ 2 & 3 & 2 \\ 1 & 1 & 2 \end{pmatrix}, A - I_{3}\lambda = \begin{pmatrix} 1 - \lambda & -1 & 0 \\ 1 & 3 - \lambda & 2 \\ 1 & 1 & 2 - \lambda \end{pmatrix}$$

$$det(A - I_{\lambda}) = \begin{vmatrix} 1 - \lambda & -1 & 0 \\ 2 & 3 - \lambda & 2 \\ 1 & 1 & 2 - \lambda \end{vmatrix} = -\begin{vmatrix} 1 + 1 + 1 & 2 - \lambda \\ 3 - \lambda & 2 & 2 - 2(2 - \lambda) \end{vmatrix} = -\begin{vmatrix} 3 - \lambda - 2 & 2 - 2(2 - \lambda) \\ -1 - (1 - \lambda) & 0 - (1 - \lambda)(2 - \lambda) \end{vmatrix} = -\begin{vmatrix} -\lambda + 1 & 3\lambda - 2 \\ \lambda - 2 & -\lambda^{2} + 3\lambda - 2 \end{vmatrix} = -\begin{vmatrix} -\lambda + 1 & 3\lambda - 2 \\ \lambda - 2 & -\lambda^{2} + 3\lambda - 2 \end{vmatrix} = -\begin{vmatrix} -\lambda + 1 & 3\lambda - 2 \\ \lambda - 2 & -\lambda^{2} + 3\lambda - 2 - 2\lambda^{2} + 4\lambda + 12\lambda - 4 = 0 \end{vmatrix}$$
